

Claims

1. A child seat for a shopping trolley, the child seat comprising a back rest made of plastic and adapted to be arranged on the shopping trolley so as to be pivotable about a horizontal axis and to which at least one seat is slidably or pivotably connected, the back rest comprises at least two parts fixedly connected to one another and constructed so that at least one portion of the back rest is formed as a hollow body, wherein the hollow body is defined by the at least two parts.
2. The child seat according to claim 1, wherein the back rest is formed from one first part and two second parts.
3. The child seat according to claim 1, wherein the parts are formed as half-shells.
4. The child seat according to claim 2, wherein the parts are formed as half-shells.
5. The child seat according to claim 1, further comprising internal reinforcing ribs in the at least one portion.
6. The child seat according to claim 2, further comprising internal reinforcing ribs in the at least one portion.
7. The child seat according to claim 3, further comprising internal reinforcing ribs in the at least one portion.

8. The child seat according to claim 1, wherein the first part has the same contour as the overall back rest.

9. The child seat according to claim 5, wherein the first part has the same contour as the overall back rest.

10. The child seat according to claim 8, wherein the contour is H-shaped.

11. The child seat according to claim 1, wherein functional elements are arranged on the first part.

12. The child seat according to claim 1, wherein the functional elements are bearing lugs, guides or openings.
